

## 10kV Busbar Parallel Safety

### Overview

Adequate spacing prevents short circuits and enhances system safety: Bare copper busbars: Minimum clearance  $\geq 20\text{mm}$  to avoid phase-to-phase or phase-to-ground faults. Insulated busbars: Insulation allows for reduced clearance but must meet IEC 60664 or UL 746C dielectric strength. GE Multilin provides protective relays that support all busbar protection techniques, including overcurrent, high-impedance differential, and percentage (low-impedance) differential. GE Multilin. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. It clarifies what was previously common but not formally correct practice. Adhering to industry standards such as IEC 61439 (low-voltage switchgear and controlgear) and UL 891 (switchboards) enhances. Our bus bar insulation system offers an alternative to cables routed in parallel and enclosed metal bus bar trunking, especially for the transmission of high currents and power, and situations where space is limited.
