

AI Server Hardware Solution

Overview

AI servers are purpose-built for artificial intelligence workloads. They typically include GPU acceleration or other specialized processors, higher memory bandwidth, and architecture optimized for sustained high utilization and large-scale data movement. Artificial Intelligence (AI) server manufacturers have experienced surging demand as data center operators require significantly more computing power than before the advent of ChatGPT and other Generative Artificial Intelligence (Gen AI) tools. Enterprises are investing billions of dollars in cloud. Dell's AI Factory platform (e. PowerEdge XE97xx/XE9712) provides high-density rack-scale clusters (72 GPUs per rack with NVLink, ~30× LLM inference speed-up and up to 25× energy efficiency advantage over prior-gen systems ()) with both liquid- and air-cooled options. HPE's Private Cloud AI. Local deployment offers faster iteration, lower latency, full control, predictable costs, and secure data. GPU: NVIDIA RTX PRO Blackwell (96 GB VRAM, 5th-gen Tensor Cores) for training/inference; rack-ready for 2U-4U servers. Our goal is to make a power density solution delivering 120 kW per rack commercially available by 2027.
