

# How long does it take for the distribution box to trip

## Overview

A: Standard residential breakers trip almost instantly during shorts and within 10–30 seconds for mild overloads. If yours take longer, it's a sign to investigate. Q: Can I change the delay rating on my existing breakers?

A: No. Operating Time: Circuit breaker operating time includes the duration from the start of contact movement to the final closed position. This is usually about half a cycle. While it might seem unimportant, this timing is critical to protect people, equipment, and wiring. A systematic diagnostic procedure gives you a step-by-step approach to inspect, measure, and analyze frequent tripping in low-voltage distribution. Over currents relays have intentional time delays in settings for avoiding trip during through fault. Differential or REF Relay senses fault and contacts make in less than 20ms, add 10 ms for master trip relay to operate, after this CB fault clearing time of less than 40ms.

Time delay from fault to breaker opening

Breaker opening time could be as long as 5 cycles, depending on the breaker. With differential protection, I'd assume a total fault duration of 150 ms a very conservative maximum duration.
