

How to measure the optical module with an optical power meter

AI Overview

Use an optical power meter to measure the transmitted power of optical modules by connecting the module to the meter, calibrating for wavelength, and reading the power output safely and accurately.

Equipment Needed

- Optical Power Meter (OPM) with a calibrated sensor suitable for the module's wavelength range (typically 800–1700 nm)
- Fiber optic patch cables compatible with the module
- Cleaning tools for fiber connectors
- Safety glasses to protect eyes from laser light

Step-by-Step Procedure

Prepare the Optical Module and Meter

- Ensure the optical module (e.g., SFP, QSFP) is powered and transmitting.
- Turn on the optical power meter and select the correct wavelength corresponding to the module's output (e.g., 1310 nm or 1550 nm) to ensure accurate readings.

Clean Fiber Connectors

Use proper fiber cleaning tools to remove dust or debris from connectors. Dirty connectors can cause signal loss and inaccurate measurements.

Connect the Module to the Power Meter

Use a fiber patch cable to connect the module's output port to the optical power meter's sensor input. Ensure a secure and proper connection to avoid signal leakage or reflection.

Set the Meter and Calibrate

If the meter requires calibration, perform it using a reference standard or follow the meter's internal calibration procedure. Some meters automatically adjust based on the detector's calibration module.

Take the Measurement

Read the optical power displayed on the meter. Most meters show power in dBm or mW. For modules with DOM/DDM (Digital Optical Monitoring), you can cross-check the transmitted power digitally on the network equipment.

Compare to Specifications

Compare the measured power to the module's datasheet specifications. Deviations beyond ± 3 dB may indicate potential issues affecting signal integrity or network performance.
