

Installation of shared cable trays for fire protection power supply

Overview

Pair trays with low-smoke, halogen-free cables in occupant areas to reduce toxic fumes. Use fire barriers, covers, and dividers to contain flame spread, especially at crossings, risers, and penetrations. Maintain clear separation between power and data circuits, and between. Cable tray installation must comply with specific technical standards to ensure electrical safety, system reliability, and long-term maintainability. This document outlines the key requirements for cable tray layout, installation, and fireproofing in industrial and commercial environments. Because of its closed design, this type of tray should be used in applications where there is minimal risk of heat generation and buildup. When equipped with a solid cover, this type of cable tray can be used in a fire-rated enclosure. These systems provide an efficient and adaptable solution for managing a wide range of cables, including power cables, control cables, Ethernet, and fiber optic lines.
