

Polishing the electrical distribution box

Overview

Electro-polishing – This technique uses a combination of a blended chemical electrolyte bath and rectified current to remove flaws from surface of an electrical enclosure. This process removes metal instead of moving or wiping it across surface. The distribution box has the characteristics of small size, simple installation, special technical performance, fixed location, unique configuration function, not limited by the site, relatively common application, stable and reliable operation, high space utilization, less land occupation and.
