

Relay protection upgrade completion time

Overview

Service upgrades, temporary disconnects, and metering changes require lead times that routinely stretch four to twelve weeks. Build that into your schedule from day one. One of the more consequential decisions at this stage is choosing between condition-based and time-based. and upgrade services allows modifying the product throughout the entire product life cycle. When requirements change, the relay functionality can be easily modified or the software upgraded to extend the lifetime of the protection solution. The modification and upgrade services are available for. This paper provides guidance for your next replacement or upgrade project, resulting in reducing cost, saving time, and minimizing unexpected or unplanned complications. Protective relaying in industrial and utility power systems has changed greatly since the beginning of system protection over a. As the durability (life) of the product varies greatly depending on the operating conditions and environment, the recommended maintenance and replacement timings are not specified. Establish and maintain its performance-based maintenance (PBM) intervals, when used, in accordance with the Tables of PRC-005.
