

Use of beam splitters in security monitoring

Overview

Beam splitters facilitate quantum information processing and secure communication protocols, playing an important role in implementing linear optical quantum gates, performing Bell state measurements, and enabling quantum key distribution (QKD). The impact of optical beam splitters on the security of quantum key distribution was studied, and it was found that the realistic device characteristics closely influence the error rate introduced by the. Abstract: The optical beam splitter is an essential device used for decoding in quantum key distribution. Modelling a beam splitter by means of a unitary transformation is physically. Beamsplitters separate incident light into two or more beams of the same wavelength. These exiting beams are differentiated by either their optical power (non-polarizing) or polarization states (polarizing).
