

View VLANs assigned by the core switch

Overview

show vlan is the primary Cisco IOS switch command for inspecting the VLAN database. It displays every VLAN that exists on the switch — including its ID, name, operational status, and the list of access ports assigned to it. It is the essential starting point when troubleshooting Layer 2. VLANs allow you to separate network devices into distinct groups, even if those devices connect to the same physical switch or to different switches. This segmentation enhances network performance, security, and manageability. It allows you to create a group of devices that share broadcast messages. The switchport mode access vlan command in the interface configuration mode of the port assigns it to a. Use VTY command to assign telnet access in Cisco Can I use VTY command in Cisco Network Assistant, if so, how?

You use VTY command to setup your Cisco to accept telnet connection. To check VLANs on your Cisco switch, you need to type “show interface Vlan” or may be it is “Show vlan” I am very much. The next three examples show how you could list data on the above VLANs. 1Q VLAN ID Name Status ----- 1
DEFAULT_VLAN Static 33 VLAN-33 Static Note: Because ports A1 and A2 are not.
