It was founded in 1987 from the merger of two state-owned semiconductor corporations, Thomson Semiconducteurs of and SGS Microelettronica of. The company is incorporated in and he.

AI Overview

The ST interface can refer to either a telecommunications interface used in ISDN networks or a debugging/programming interface for STMicroelectronics microcontrollers.

ST Interface in Telecommunications In the context of ISDN (Integrated Services Digital Network) and early Frame Relay networks, the ST interface is a physical and logical interface that connects terminal equipment (TE) to network termination (NT) devices. It uses pseudo-ternary signaling, where a binary 0 is represented by alternating positive and negative voltages, and a binary 1 is represented by the absence of voltage. This signaling method ensures DC balance and prevents voltage drift over the line. Synchronization is maintained using bipolar violations (BPV), which occur when two consecutive zeros change polarity, allowing the system to distinguish between consecutive 1s and 0s. The ST interface organizes data into frames with specific offsets for incoming and outgoing signals, and the network controls line activation, not the terminal equipment.

ST Interface in Microcontroller Development In the context of STMicroelectronics, the ST interface often refers to the ST-LINK interface, a hardware and firmware solution used for debugging and programming STM32 microcontrollers. ST-LINK devices connect via USB to a host computer and provide access to the microcontroller's programming and debugging features. There are multiple versions, including ST-LINK/V2, ST-LINK/V2-...
