

Where to plug the splitter cable

AI Overview

Always start by connecting the source cable to the splitter's input port before connecting your devices to the output ports. For Cable or Internet Splitters Identify the input port on the splitter, usually labeled "IN" or "Input". Connect the source cable (from your modem, antenna, or service provider) to this input port. Connect output cables from the splitter's "OUT" ports to your devices, such as TVs, modems, or DVRs. Check connections to ensure they are secure and free from damage. If the splitter requires power, make sure it is plugged in and turned on. For DJ or Audio Splitter Cables Locate the main audio source, typically the headphones-out or audio-out socket on your computer or DJ controller. Plug the splitter cable into this source. The splitter will divide the stereo signal into two separate outputs. Connect one output to your headphones and the other to your speakers or audience output. Verify the signal by playing audio and ensuring both outputs are functioning correctly. Tips Always turn off devices before connecting or disconnecting cables to prevent damage. Use high-quality cables to minimize signal loss, especially for coaxial or internet splitters. For multiple splitters, connect the primary splitter first, then link outputs to secondary splitters if needed, keeping signal strength in mind. By starting with the source cable in the splitter's input port and then connecting your devices to the output ports, you ensure proper signal distribution and avoid common issues like weak signals or audio imbalance.
